

## MEMORANDUM

**To:** CMAP Transportation Committee

**From:** CMAP staff

**Date:** February 19, 2026

**Subject:** Update on the Comprehensive Climate Action Plan for Greater Chicago

**Action Requested:** Discussion

---

---

### Purpose

The project team will update the Transportation Committee on the development of the Comprehensive Climate Action Plan (CAP) for Greater Chicago, funded by the U.S. Environmental Protection Agency's Climate Pollution Reduction Grant. The CAP was created through a partnership between the CMAP, Metropolitan Mayors Caucus, and Northwestern Indiana Regional Planning Commission. It serves as the first regional framework to address all major greenhouse gas emissions across a 13-county area spanning Illinois, Indiana, and Wisconsin.<sup>1</sup>

Since the CAP team last met with the committee in August 2024, the team engaged with the CAP steering committee and working groups over the span of 14 months to seek feedback through the plan development process and the CAP was submitted to USEPA in advance of the December 2025 deadline. Since completing the plan content, the CAP team has focused on preparing the document for public release, including design, formatting, and accessibility enhancements. The plan will be published in March 2026.

At the February meeting, staff will give an overview of the soon-to-be released CAP, identifying the plan's study area, its emissions profile, and the future policy scenarios outlined in the plan. Staff will also highlight the plan's core actions with a focus on the key transportation strategies that are central to reducing the Greater Chicago region's transportation sector emissions — reducing vehicle miles traveled and electrifying vehicles. For more details on the plan, visit [CMAP's climate action webpage](#) in March to read the full plan.

Below are key project updates, identifying key milestones that occurred between August 2024 and December 2025 but will not be discussed at length during the February meeting. Following the project updates is additional information about the final plan structure and CMAP's next steps.

---

# 1. Project updates

## 1.1. Emissions profile

CMAP staff updated the 2020 Greenhouse Gas Inventory<sup>2</sup> for the 13-county planning area.<sup>3</sup> In 2020, the 13 counties produced approximately 152 million metric tons of carbon dioxide equivalent (MMT CO<sub>2</sub>e) of GHG emissions (Figure 1).

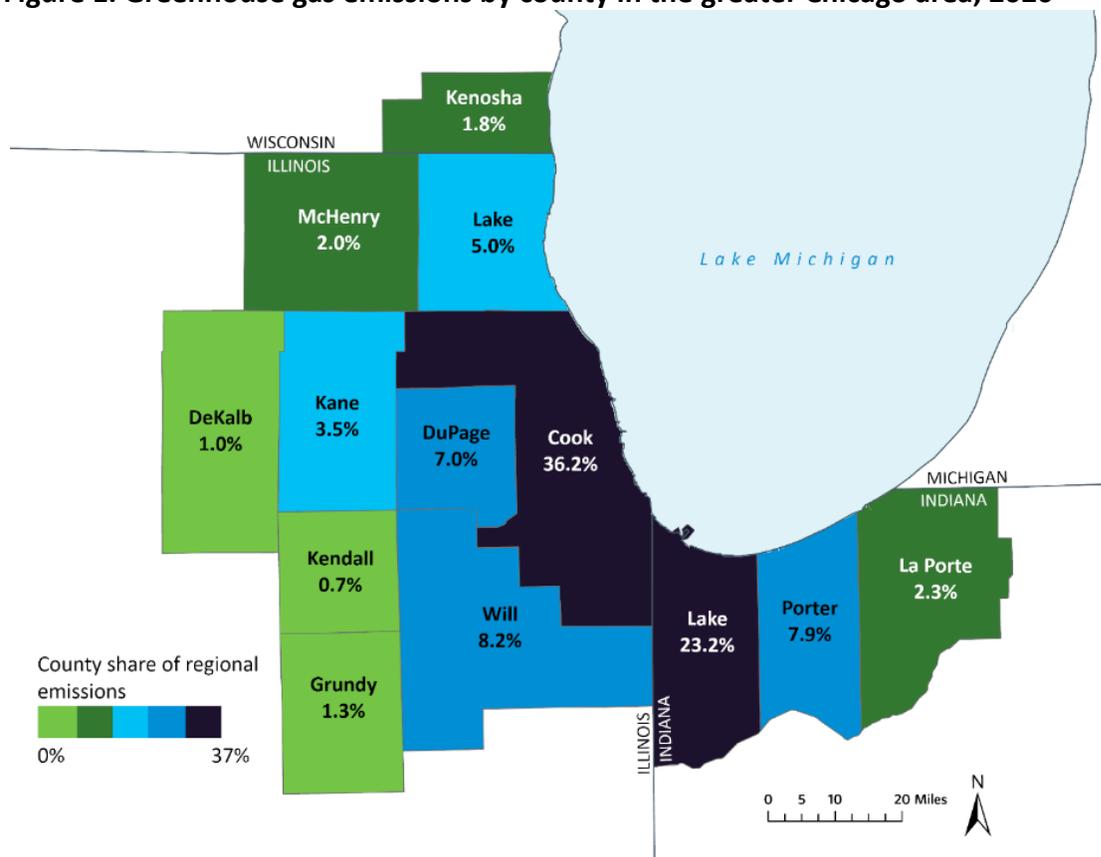

Most emissions come from three sectors:

- **Industry** (36%): reflecting the region's concentration of steelmaking, refining, and manufacturing.
- **Buildings** (35%): driven largely by fossil-fuel-based heating in homes, businesses, and institutions.
- **Transportation** (26%): primarily gasoline and diesel used for passenger and freight travel.

Smaller but important shares come from agriculture, waste, and water and wastewater systems, while trees and wetlands remove about 2 percent of total annual regional emissions through carbon sequestration.

Emissions vary significantly between counties. While Cook County produces the most total emissions, industrial counties in northwest Indiana have the highest emissions per person. This highlights how development patterns, transportation assets, and industry clusters shape the region's emissions landscape — and the need for strategies tailored to each county's unique profile. See the plan's *Chapter 2. GHG emissions and trends* for more information.

## 1.2. Economy-wide reduction targets

The CAP Steering Committee confirmed the plan’s target to reduce gross greenhouse gas emissions 48 percent by 2035 and 86 percent by 2050 relative to 2005 levels.<sup>4</sup> The plan uses economy-wide modeling to identify the reductions needed in each sector to achieve this regional target, recognizing that decarbonization potential varies across sectors (see Tables 1 and 2).

**Table 1. Sector reduction targets for the 13-county region to achieve the plan’s overall reduction targets**

Sector	Emissions (MMT CO <sub>2</sub> e)				Reduction needed (from 2005)	
	2005	2020	2035	2050	2035	2050
Buildings	66.64	53.99	36.54	3.35	-45%	-95%
Transportation	56.05	39.57	21.77	4.89	-61%	-91%
Industry	65.15	55.95	39.36	15.14	-40%	-77%
Waste	1.54	0.96	0.66	0.70	-57%	-56%
Water and wastewater	-	1.70	1.10	0.57	-	-
Agriculture	2.13	2.14	1.56	1.56	-27%	-27%

<b>Gross emissions</b>	192.92	154.27	100.48	26.23	-48%	-86%
------------------------	--------	--------	--------	-------	------	------

Note: 2005 water and wastewater emissions are included within the buildings and waste sectors due to limited data availability for these sources during that year.

**Table 2. Emission offsets by natural carbon sequestration for the 13-county region**

Sector	Emissions captured (MMT CO2e)				Increase in emissions offset	
	2005	2020	2035	2050	2035	2050
Natural carbon sequestration	3.57	2.74	4.15	6.25	16%	75%

### 1.3. Emissions modeling

The project team used E3’s Pathways model to create the future GHG emissions scenarios. Pathways is an economy-wide energy and greenhouse gas emissions accounting model designed to help policymakers evaluate strategies for decarbonization. It is not an optimization model; instead, it compares user-defined scenarios to show the impacts of different climate and energy policy choices.

For each reduction strategy, the team specified key assumptions that influence energy demand, such as electric vehicle adoption or building heating needs. The Pathways model then estimates annual energy use and greenhouse gas emissions across all major sectors, including residential and commercial buildings, industry, and transportation, among others.

With the guidance and expertise of CAP sector-specific working groups for transportation, buildings, and industry, as well as community working group and CMAP’s climate committee, the project team developed a series of emission reduction strategies to be included in the plan. These strategies were informed by recommendations from recent regional decarbonization efforts as well as national and state-level efforts and refined over the course of the project. For more information on this process, see the meeting materials with these groups on the project’s [webpage](#).

The project team then grouped GHG reduction strategies into three scenarios – the current policy scenario, the plan implementation scenario, and the state and local portion of the plan implementation scenario, as described in Section 1.4.<sup>5</sup>

### 1.4. Future emissions scenarios

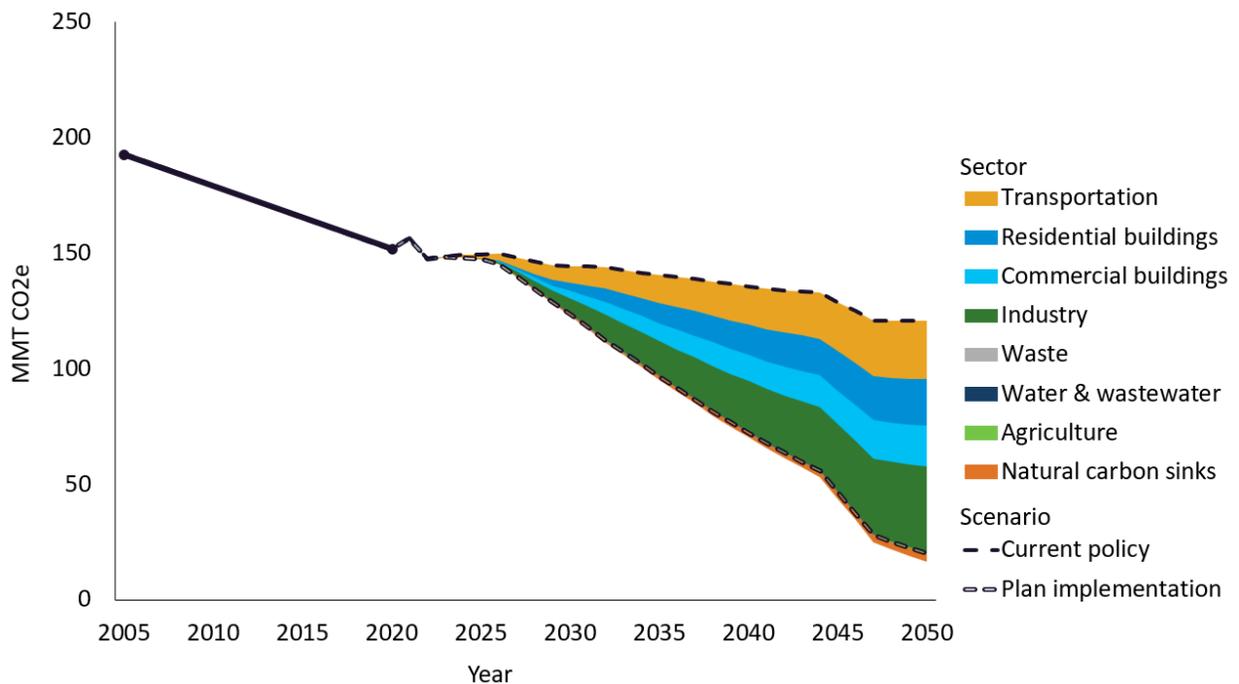

Three policy scenarios illustrate the range of emissions reductions achievable under different levels of policy ambition and coordination (Figures 2 and 3):

- **Current policy scenario:** Reflects existing federal and state policies — such as Illinois’ Climate and Equitable Jobs Act (CEJA) — and represents a business-as-usual trajectory, reducing emissions 26 percent by 2035 and 36 percent by 2050.

- **Plan implementation scenario:** Demonstrates that the region can meet its economywide GHG reduction target through full adoption of 30+ modeled strategies across all major emissions sectors, reaching 48 percent by 2035 and 86 percent by 2050.
- **State and local scenario:** Highlights the extent of reductions achievable under the plan implementation scenario that do not require new federal action, achieving a 58 percent reduction by 2050.

Together, these trajectories highlight both the urgency of acting now and the necessity of coordinating efforts across all scales of government. Deep emissions reductions are within reach but only if communities, states, and federal partners move forward together. See the plan’s *Chapter 3 The path forward* for more information.

## 2. Plan structure

The plan is organized into eleven chapters, described below. It also includes an executive summary that provides a high-level overview of the roadmap to decarbonize the region, along with several appendices that offer additional technical detail.

1. **Introduction** – Makes the case for climate action by describing current and future climate impacts, as well as the plan purpose and planning process, including engagement.
2. **GHG emissions and trends** – Summarizes the 2020 GHG inventory for Greater Chicago by sector and geography and describes regional emissions trends from 2005 to 2020.
3. **The path forward** – Describes the level of ambition required to achieve an 85 percent reduction in gross emissions by 2050. Presents three modeled emissions reduction scenarios: current policy, plan implementation, and the state and local portion of the plan implementation scenario. Highlights how achieving the plan’s goals can also deliver community benefits, such as improved air quality and public health. Explains how GHG reductions can be achieved for each sector through strategies implemented across multiple levels of governments and non-government partners.
- 4.-11. **Sectors** – Includes individual chapters for the seven emissions sectors, including:

buildings, transportation, industry, energy generation, waste, water and wastewater, and agriculture, as well as natural carbon sequestration.

The appendices cover: stakeholder and community engagement (Appendix A), GHG inventory methodology (Appendix B), GHG reduction quantification and benefits analysis methodology (Appendix C), modeled strategies and cost estimates (Appendix D), and workforce planning analysis (Appendix E).

### **3. Next steps**

Following the February meeting, the project team will be presenting the plan to other CMAP committees and stakeholders. The project team will also highlight key components of the plan in agency communications and is exploring how CMAP can best support plan implementation.

---

<sup>1</sup> Given that the study area does not coincide with a single governmental jurisdiction, the plan will not be formally adopted and will instead serve as a framework to inform planning efforts at the MPO and local government levels as well as needed action from the federal and state levels.

<sup>2</sup> Pandemic-related changes in transportation and energy consumption make 2020 an anomalous year for some datasets, but it is still a viable year for this analysis. The inventory is built using modeled and reported data from various time scales and geographies, which reduces the impacts of short-term fluctuations, such as those experienced in 2020. The inventory results are comparable to past efforts to study emissions in the region.

<sup>3</sup> In November 2024, the 2020 Greenhouse Gas Inventory was updated to incorporate state-specific eGRID emission factors for quantifying the GHG impacts of electricity consumption. These updated factors significantly impacted emissions in the residential, commercial, and industrial building subsectors. Illinois counties experienced a decrease in emissions due to a lower emissions factor, while Indiana and Wisconsin saw increased emissions due to a more carbon-intensive emissions factor.

<sup>4</sup> To meet the grant requirements, the plan needed to present emissions reductions relative to 2005 levels, requiring the development of a 2005 baseline inventory. CMAP used USEPA's State Inventory Tool to extract emissions data, for the three states included in this plan, and then applied county level shares from the plan inventory to estimate 2005 emissions for the greater Chicago area.

<sup>5</sup> Not all strategies included in the plan could be included in the modeling. See the plan's Appendix C for more details on the GHG reduction quantification methodology and Appendix D for the complete list of modeled strategies.
